2)   For the second part, I investigated pytest. The biggest difference I saw was how it ran and how it looked when it ran. When pytest is compared to unittest, the UI is different. Given, it still displays the same info, just in a different (cleaner in my opinion) way. Furthermore, you must install pytest via a command like command and import it in the file, as opposed to just importing it for unittest. The last major difference is how the tests are calling in the command line. I was able to make the tests with little to no issues using pytest. The coding for it seemed much more intuitive for me as opposed to unittest. All in all, I would still recommend knowing unittest even if you prefer pytest, because more ways to test could never hurt.
